A-B processes: Towards Energy Self-sufficient Municipal Wastewater Treatment Biological Wastewater Treatment: Principles, Modeling and Design *Yu Liu Guang-Hao Chen*

the principle of the conventional activated sludge cas for municipal wastewater treatment is primarily based on biological oxidation by which organic matters are converted to biomass and carbon dioxide after more than 100 years successful application the cas process is receiving increasing critiques on its high energy consumption and excessive sludge generation currently almost all municipal wastewater treatment plants with the cas as a core process are being operated in an energy negative fashion to tackle such challenging situations there is a need to re examine the present wastewater treatment philosophy by developing and adopting novel process configurations and emerging technologies the solutions going forward should rely on the ways to improve direct energy recovery from wastewater while minimizing in plant energy consumption this book begins with a critical overview of the energy situation and challenges in current municipal wastewater treatment plants showing the necessity of the paradigm shift from removal to recovery in terms of energy and resource as such the concept of a b process is discussed in detail in the book

it appears that various a b process configurations are able to provide possible engineering solutions in which a stage is primarily designed for cod capture with the aim for direct anaerobic treatment without producing excessive biosludge while b stage is designated for nitrogen removal making the wastewater treatment energy self sustainable is obviously of global significance and eventually may become a game changer for the global market of the municipal wastewater reclamation technology the principal audiences include practitioners professionals university researchers undergraduate and postgraduate students who are interested and specialized in municipal wastewater treatment and process design environmental engineering and environmental biotechnology

the first edition of this book was published in 2008 and it went on to become iwa publishing s bestseller clearly there was a need for it because over the twenty years prior to 2008 the knowledge and understanding of wastewater treatment had advanced extensively and moved away from empirically based approaches to a fundamental first principles approach based on chemistry microbiology physical and bioprocess engineering mathematics and modelling however the quantity complexity and diversity of these new developments was overwhelming for young water professionals particularly in developing countries without readily available access to advanced level tertiary education courses in wastewater treatment for a whole new generation of young scientists and engineers entering the wastewater treatment profession this book assembled and integrated the postgraduate course material of a dozen or so professors from research groups around the world who have made significant contributions to the advances in wastewater treatment this material had matured to the degree that it had been codified into mathematical models for simulation with computers the first edition of the book offered that upon completion of an in depth study of its contents the modern approach of modelling and simulation in wastewater treatment plant design and operation could be embraced with deeper insight

advanced knowledge and greater confidence be it activated sludge biological nitrogen and phosphorus removal secondary settling tanks or biofilm systems however the advances and developments in wastewater treatment have accelerated over the past 12 years since publication of the first edition while all the chapters of the first edition have been updated to accommodate these advances and developments some such as granular sludge membrane bioreactors sulphur conversion based bioprocesses and biofilm reactors which were new in 2008 have matured into new industry approaches and are also now included in this second edition the target readership of this second edition remains the young water professionals who will still be active in the field of protecting our precious water resources long after the aging professors who are leading some of these advances have retired the authors all still active in the field are aware that cleaning dirty water has become more complex but that it is even more urgent now than 12 years ago and offer this second edition to help the young water professionals engage with the scientific and bioprocess engineering principles of wastewater treatment science and technology with deeper insight advanced knowledge and greater confidence built on stronger competence
